Support research on mental health among farmers

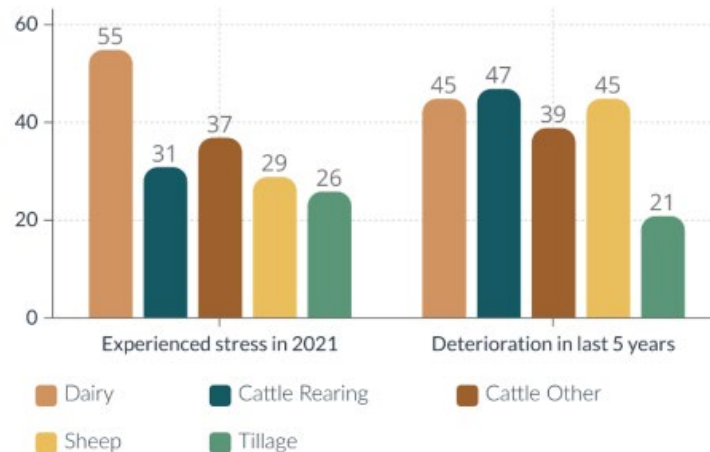

Dying to Farm: Developing a Suicide Prevention Intervention for Farmers in Ireland

Funded by the HSE National Office for Suicide Prevention, here in the School of Agriculture & Food Science, M Russell, Prof. Louise McHugh, & Ms. Anne Markey are exploring factors impacting farmer well-being and desire to develop our understanding of farmers' mental health and how we can best support farmers.

Farmer health & wellbeing

Farm business related stress

Across farm systems
78%
 of farmers reported good or very good health

31% of Sheep farmers report poor or fair health

53% of farmers with poor or fair health have an identified replacement, lowest on Sheep farms at 31%.

Recent evidence-based research identified a **high prevalence** of musculoskeletal injury among Irish farmers.

A survey of 600 Irish farmers (100 farmers from each of the six main farm enterprise systems in Ireland) found that 56% of farmers had experienced a musculoskeletal injury. The most common types of injury or disorder were related to the back (37%).

To get a better understanding of the lived experience of back pain/injury among Irish farmers, detailed interviews were conducted with a number of farmers. Interviews explored how the farmer suffered the first time, the type of work that they regularly carry out on the farm, the changes made on the farm due to their back and how they manage their pain on a daily basis.
